

Entergy's Arkansas River Lights

Entergy Arkansas celebrated its own centennial by installing super-efficient, brilliant LED lighting on three river bridges in downtown Little Rock. Brown Engineers designed the power systems and fiber optic cable communications, and supported the onsite field tests.

Our design reused a LOT of old, existing wire and conduit--some over 50 years old--adapting it to support modern technology and communications.

This sustainable approach saved money and time, helping Entergy deliver this gift on schedule and in budget. Our design also keeps maintenance of the lights on the heavily traveled Main Street Bridge within the safety of its pedestrian lanes, away from traffic.

"This project has the power to change how people view this city and this state."

***Hugh McDonald,
President and CEO, Entergy Arkansas***
